FIELD PROTECTIVE MASK,  
M40/M42 SERIES

**Mission**
To provide respiratory, eye, and face protection against chemical and biological agents, radioactive fallout particles, and battlefield contaminants

**Entered Army Service**
1992

**Description and Specifications**
The M40 series protective masks replace the M17 series protective masks as the standard Army field mask. The mask consists of a silicone rubber face piece with an in-turned peripheral face seal, binocular rigid eye lens system and elastic head harness. Other features include front and side voicemitters allowing better communication particularly when operating FM communications, drink tube for a drinking capability while being worn, clear and tinted inserts, and a filter canister with NATO standard threads. Because of these features, the mask can be worn continuously for 8 to 12 hours.

The face-mounted canister (gas and aerosol filter) can be worn on either the left or the right cheek, and will withstand a maximum of 15 nerve, choking, and blister agent attacks. It will also withstand a maximum of two blood agent attacks. Biological agents do not degrade the filter.

Several mask improvements have been introduced over the years through Pre-Planned Product Improvement (P3I) Programs, which resulted in M40A1 and M40A2 configurations. The improvements include a quick-doff hood, second skin, canister interoperability (M42A1 only), and voice amplification (M7), new nosecup, two new carriers, and improved vision correction. An additional product improvement was adopted in late 1994, which upgraded the M42 to the M42A2 configuration. This change provides a detachable microphone that improves reliability, simplifies production, and permits field replacements.
